

Reginald Johnson

Platform Engineer

reggiejohnson1997@gmail.com | 202-538-0082 | Charlotte, NC 28277 | linkedin.com/in/reginald-johnson-jr-9aa348120 | Open to Relocate

SUMMARY

Platform Engineer with 4+ years of experience building the infrastructure and tooling that engineering teams depend on. Started my career teaching 150+ engineers how to code and build production software, and that experience shaped how I approach platform work: I build for the engineer on the other side. At Red Ventures I designed a custom Terraform provider adopted company-wide by 50+ engineers, automated \$3,000 to \$8,000 per month in cloud savings through Golang and Bash scripting, and served as the sole owner of infrastructure incident response for 2+ years resolving 75+ incidents independently. Core stack: Terraform, Golang, AWS, Docker, GitHub Actions, Git, and Bash.

SKILLS

Cloud and Infrastructure: AWS (Lambda, RDS, ECS, S3, IAM, KMS), Terraform, Docker, GitHub Actions, Splunk

Languages: Golang, Python, JavaScript, Bash, C# / .NET

Version Control: Git, GitHub, GitHub Actions

Frontend: React, TypeScript, Cohesion

Data and BI: SQL, Power BI

Practices: CI/CD, DevOps, Infrastructure as Code (IaC), Containerization, Serverless Architecture, Cloud Cost Optimization, Scripting and Automation

EXPERIENCE

Platform Engineer | Red Ventures

June 2023 - Present | Charlotte, NC

Stack: Golang, Terraform, Bash, AWS (Lambda, ECS, S3, IAM, KMS), GitHub Actions, Git, Splunk, Docker

- Designed and shipped a custom Terraform provider in Golang that became the company-wide standard for infrastructure provisioning, adopted by 50+ engineers across all teams. Any developer can launch a fully configured project from their CLI under the org namespace without touching raw Terraform config.
- Wrote Golang and Bash automation scripts to scan for and remove unused AWS resources on a recurring schedule, reducing monthly cloud spend by 10% and saving approximately \$3,000 to \$8,000 per month with no manual intervention required.
- Built and maintained Terraform modules across 5+ high-traffic production environments supporting ECS and Lambda workloads, cutting provisioning time by 15% and standardizing environment configuration to prevent deployment failures caused by config drift.
- Wired infrastructure into GitHub Actions and the internal developer platform (Volt) using custom Bash scripts and Terraform automation, enabling fully automated end-to-end deployments and removing all manual release steps from the engineering workflow.
- Improved infrastructure observability by building tooling to surface Terraform state and deployment logs directly in developer workflows via Splunk dashboards, reducing the time engineers spent debugging environment failures without platform team involvement.
- Sole owner of infrastructure incident response for 2+ years, independently resolving 75+ incidents across production environments and cutting average resolution time by 40% through systematic root cause analysis and Git-tracked runbook documentation.

Software Engineer | Red Ventures

May 2022 - June 2023 | Charlotte, NC

Stack: C# / .NET, AWS (Lambda, RDS), React, TypeScript, Cohesion, Slack API, Git

- Contributed to backend reliability for ADT's call center operations through proactive Splunk alerting, on-call incident response, and regular system health reviews, helping the team sustain high availability on a system with a 99.99% uptime SLA.

- Built C# services to ingest and process call center wrap-up data, persisting structured records to AWS RDS with explicit error handling, retry logic, and dead-letter queuing to ensure no records were silently dropped.
- Built automated pipelines to generate encrypted compliance reports and push them to ADT on a 4-hour cycle via secure file transfer, replacing a manual process that was error-prone and difficult to audit.
- Built an AWS Lambda integrated with the Slack API that gave business stakeholders real-time control over traffic routing between primary and secondary sites, removing the need for an on-call engineer to execute a manual deploy during traffic shifts.
- Contributed to frontend development in React and TypeScript, building seasonal promotional pages for high-traffic sales campaigns and collaborating with design on component-level work using the Cohesion design system.

Technical Instructor | Road to Hire

January 2020 - June 2022 | Charlotte, NC

Stack: HTML, CSS, JavaScript, React, Node.js, .NET, SQL, AWS, Git, Bash, System Design

- Taught and mentored 150+ aspiring software engineers through an intensive backend curriculum. 85% of graduates secured engineering roles at companies including Duke Energy, Bank of America, and NASCAR.
- Designed project-based lessons spanning the full stack: HTML, CSS, JavaScript, React, Node.js, .NET, SQL, AWS, Git, and Bash. Curriculum was aligned directly to what companies actually interview for, giving students practical experience rather than textbook theory.
- Built personalized growth plans and ran mock interview sessions focused on both technical problem solving and communicating engineering decisions clearly under pressure.
- Led outreach programs and coding workshops at local high schools, building early pipelines into tech careers for students with no prior exposure to software engineering.

PROJECTS

Chicago Bulls Analytics | Python, SQL, React, GitHub Actions, Git

March 2026

- Built an end-to-end data pipeline using Python (pandas, requests) to pull, clean, and transform raw NBA API data into structured datasets, then wrote SQL queries to surface player efficiency trends and team performance patterns across a full season.
- Built a React dashboard to visualize the processed data, including shot efficiency breakdowns, lineup impact scores, and game-by-game trend charts that would not be visible in raw box score data.

Nuvy Platform | Golang, AWS, Terraform, React, GitHub Actions, Git, Bash

November 2025

- Live deployed application built to streamline how I launch personal projects. Designed a Golang backend API with a React frontend, wired up CI/CD with GitHub Actions and Bash scripts for automated testing and deployment on every commit.
- Provisioned and managed all AWS infrastructure using Terraform, including networking, compute, and storage layers, with separate environment configs to practice the same multi-environment patterns used in production at Red Ventures.
- Built a deployment workflow that takes a user-uploaded React or static app and automatically provisions the full hosting stack through Terraform and AWS, giving any user a live URL without any manual infrastructure setup.

CERTIFICATIONS

AWS Solutions Architect Associate (2023) **HashiCorp Terraform Associate** (2023)

EDUCATION

Frostburg State University | Electrical Engineering | 2018
